

# MORA Routing and Capacity Building in Disruption-Tolerant Networks

Natascha Widder

December 12, 2008

# MORA Routing and Capacity Building in Disruption-Tolerant Networks

Seminar: Ad Hoc Networks

- Seminar: Ad Hoc Networks WS 08/09
- chair: Computer Networks and Telematic
- University Freiburg
- The paper is written by Burn, Brock and Levine
- they are members of the Department of Computer Science of the University of Massachusetts Amherst

# What is DTN?

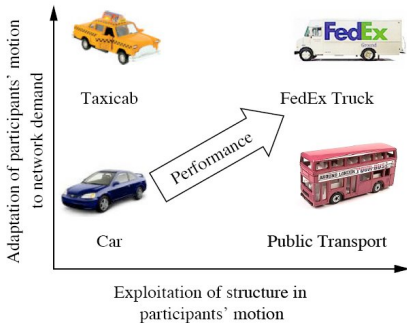

- DTN = Disruption-Tolerant Network
- It is used in areas where infrastructures are missing
- It is a mobile AdHoc-Wireless-Network

# What is DTN ?

- Performance depends on the number of participants, their storage capacity, communication capabilities, and movement patterns
- In the paper, the focus is on the performance factor (movement patterns of participants)

# What is the problem?

- the participants operate like cars in normal traffic

- it is difficult to coordinate the movement of the participants

- Goal: To improve the performance
- metric : bandwidth and delay

# How to improve performance?

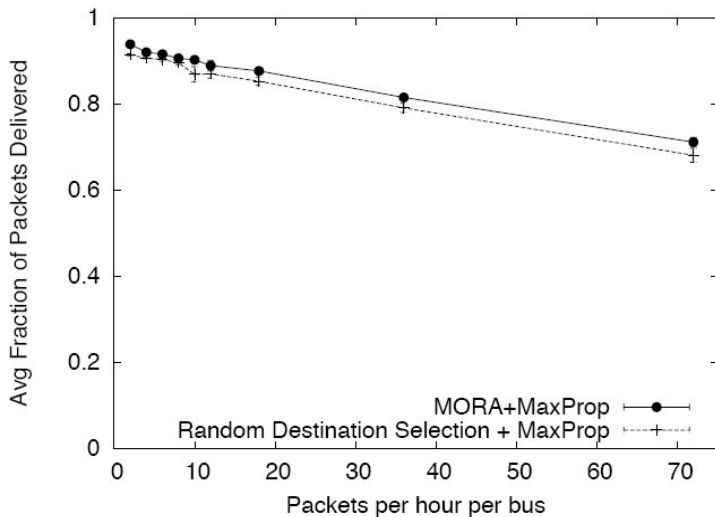

- use protocol MORA (=Multi-Objective Robotic Assistance)
- it set autonomous agents as participants into the DTN
- agents hold and try to get information about the network
- agents try to balance the network demand by movement

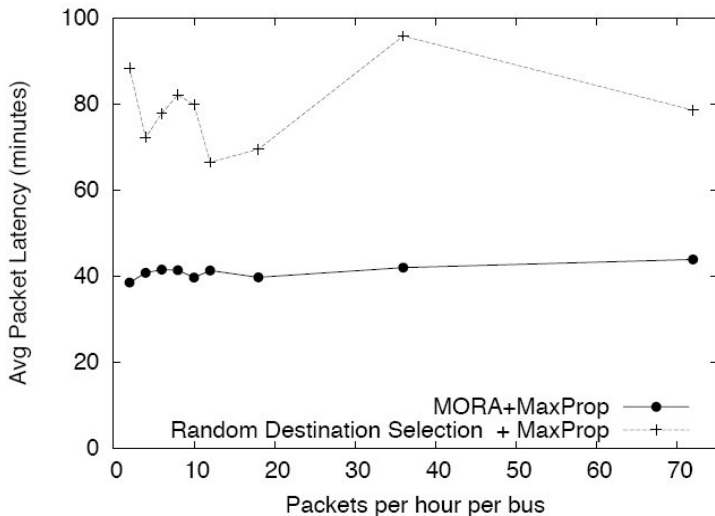

- to get the optimize movement is NP-hard
- multi-objective control is used to decided the motion of agents
- this control methods are presented by controllers

# Statistic of Delivered Packets MORA+MaxProp

# statistic of Latency MORA+MaxProp

- MaxProp performance: from 67% to 88%
- MaxProp delay : from 120 min to 76 min
- also it improve Random, FIFO and ME/ DLE

- To improve the performance of DTN use MORA
- MORA set autonomous agents in the DTN
- To get the optimize movement use control methods

Thank you for your attention
